

La valorizzazione del dato

Alberto RICCABONE - Avio Aero

Data has a better idea

Our Challenge

Secure by Design and Zero Trust

Int'l Trade Compliance & IP protection driving very granular data segregation

Coopetition in inter-organizational teams

Exponential growth of volume and velocity of data generated and exchanged

Business requirements more complex than ever

Data sovereignty

Confidential computing

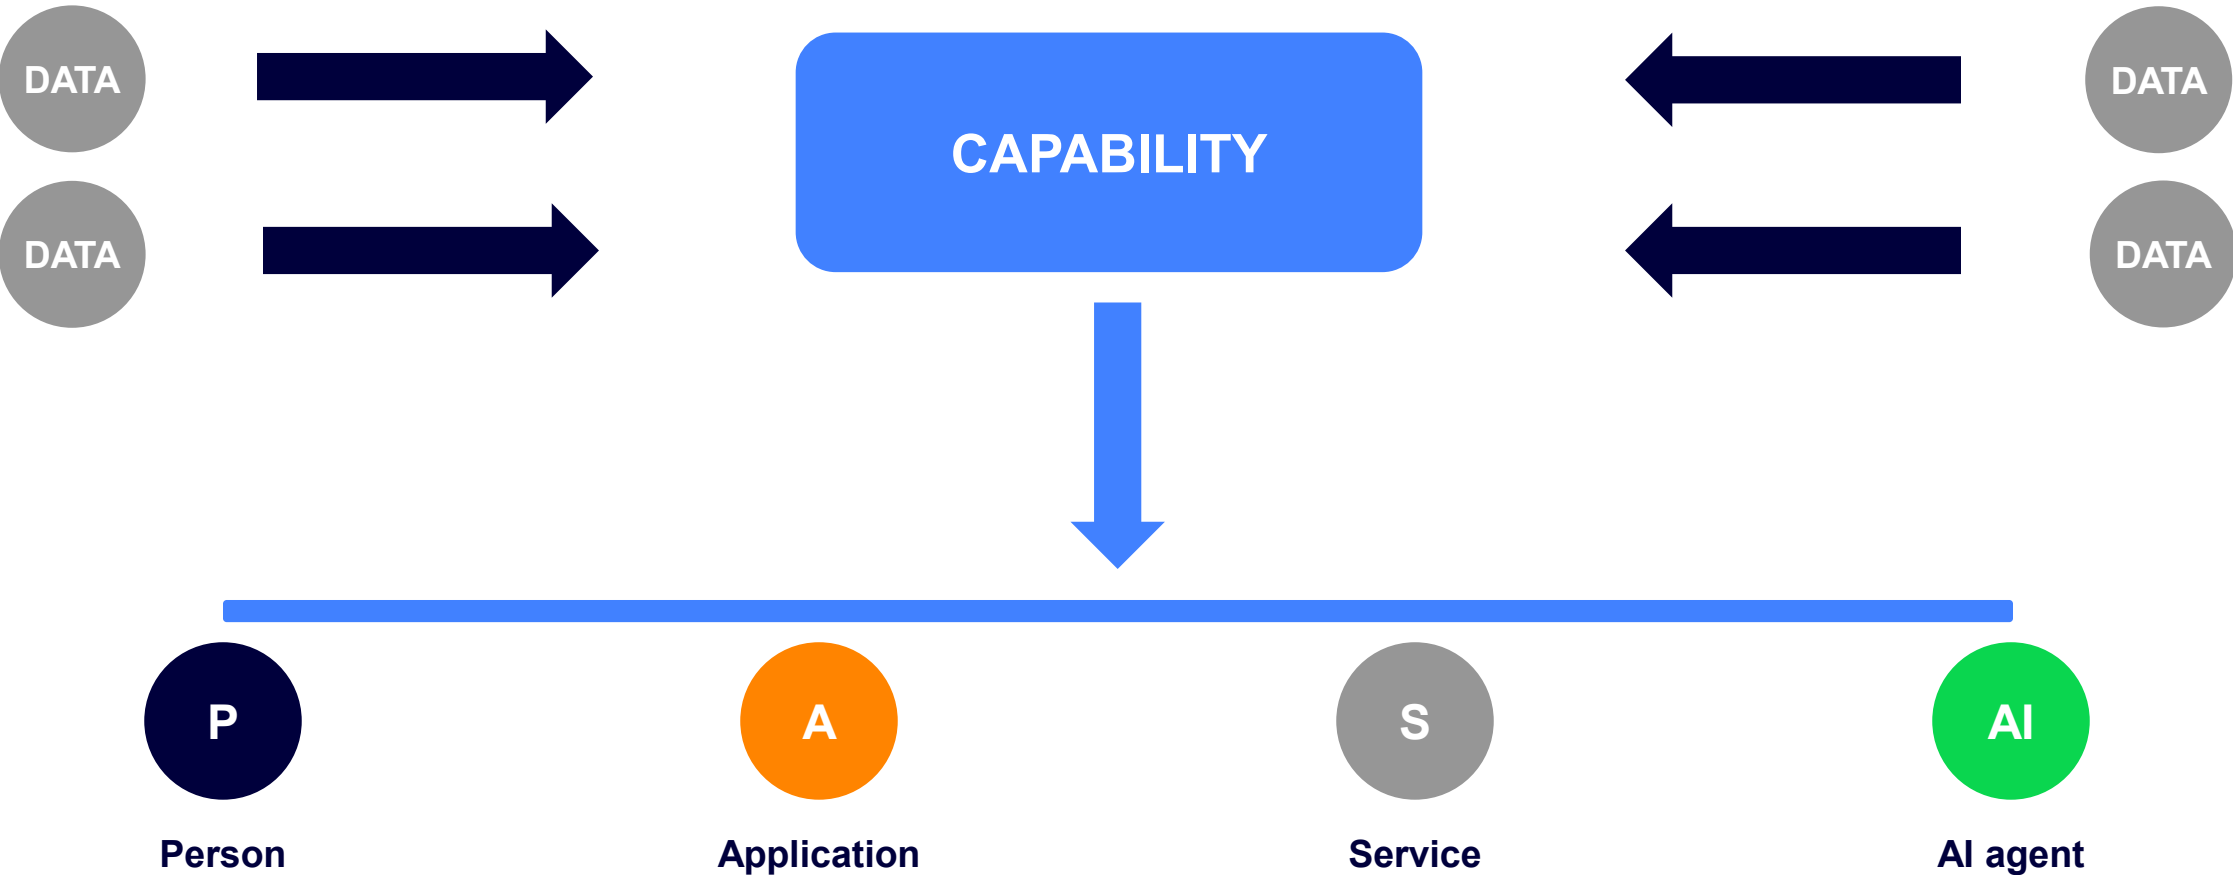

AI workforce empowerment

We need to
rethink
how we operate

Data alone it's not a capability

The real asset is the ability to turn data and domain logic into something others can consume

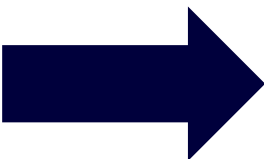

From feature to capability: a new Definition of Done

Features

user need → requirement → feature → test → deploy

The feature works for the user who requested it.

Capability

need → capability → multiple consumers

The capability is usable by whoever needs it — human, application or AI.

AI doesn't change the need for good architecture. It makes the consequences of bad architecture far more visible.

Our future

Build an ecosystem where data, information and domain capabilities are accessible, interoperable, governed and reusable.

Do not assume who the future consumers will be — another application, another process, a partner, or an AI system.

Requirements and Definition of Done need to be different.

Data has a better idea... let's turn data into the capacity to act.
